Abstract

Background: Human Anatomy is taught in the first year of the Bachelor of Homoeopathic Medicine and Surgery (BHMS) programme, while Community Medicine is taught in later years. The two subjects are rarely connected in teaching, although almost every public-health problem has a structural (anatomical) basis. The Competency Based Dynamic Curriculum (CBDC) of the National Commission for Homoeopathy now asks for horizontal and vertical integration between subjects.

Objective: To review and synthesise the literature on the interface between Human Anatomy and Community Medicine, and to interpret this interface from the perspective of Homoeopathic Medicine.

Methods: An integrative narrative review was carried out. Standard textbooks, WHO and Government of India reports, curriculum documents, and peer-reviewed articles indexed in PubMed and Google Scholar were searched using combinations of the terms "anatomy", "community medicine", "public health", "anthropometry", "ergonomics", "medical curriculum integration" and "homoeopathy". Findings were organised thematically, following SANRA guidance for narrative reviews.

Results: Seven interfaces were identified: (1) anthropometry and nutrition, (2) maternal and child health, (3) occupational health and ergonomics, (4) injury and accident prevention, (5) non-communicable and musculoskeletal diseases, (6) communicable diseases and environmental health, and (7) health education and screening. In homoeopathy, anatomy supports the physical examination, the understanding of constitution and the study of pathological generals, while community medicine extends Hahnemann's concept of the obstacle to cure and the maintaining cause to the population level.

Conclusion: Anatomy and Community Medicine are complementary. Integrated, case-based teaching that links structure to population health can produce homoeopathic physicians better prepared for primary health care in India.

Keywords: Human anatomy; Community medicine; Public health; Homoeopathy; Curriculum integration; Anthropometry; Ergonomics; CBDC

1. Introduction

Human Anatomy is the study of the structure of the human body. It is the foundation on which physiology, pathology, surgery and clinical medicine are built [1]. Community Medicine (Preventive and Social Medicine) studies health and disease in populations. It deals with epidemiology, prevention, health promotion and the organisation of health services [2].

At first sight, the two subjects appear far apart. Anatomy looks at one body in detail, often in a dissection hall. Community Medicine looks at whole populations, often in villages, schools and factories. Yet the two meet constantly. A child's mid-upper arm circumference, a worker's low back pain, a pregnant woman's pelvic measurements, a road-traffic head injury and an iodine-deficiency goitre are all anatomical facts with public-health meaning [2,9,10,12].

The Declaration of Alma-Ata (1978) placed primary health care at the centre of health systems [4]. The Lancet Commission on health professional education later called for curricula that prepare graduates for the needs of the population, not only of the hospital [16]. In India, the National Commission for Homoeopathy (NCH) introduced the Competency Based Dynamic Curriculum (CBDC) for BHMS, which encourages horizontal and vertical integration of subjects [5]. Harden's integration ladder describes how such integration can move from isolated teaching to fully trans-disciplinary learning [15].

Homoeopathy adds its own dimension. Hahnemann asked the physician to know what is to be cured in disease, what is curative in medicines, and the obstacles to recovery [3]. He also asked the physician to identify and remove the exciting and maintaining causes of disease, including occupation, habits and living conditions [3]. These are, in essence, the concerns of Community Medicine.

Despite this, there is little literature that brings Anatomy, Community Medicine and Homoeopathy together. The aim of this review is to (a) map the interface between Human Anatomy and Community Medicine, (b) interpret it from the homoeopathic standpoint, and (c) suggest how it may be used in BHMS teaching and community practice.

2. Methodology

Design: An integrative narrative literature review. The narrative approach was chosen because the topic crosses three disciplines and the evidence is mostly textbook, policy and conceptual literature rather than trials [6,8]. The review was written following the six items of the SANRA scale for narrative reviews [7].

Sources searched: PubMed, Google Scholar and DOAJ; WHO and Government of India (MoHFW, Ministry of AYUSH, NCH) websites; standard textbooks of Anatomy, Community Medicine and Homoeopathic Philosophy and Materia Medica.

Search terms: "human anatomy" OR "anatomical" AND "community medicine" OR "public health" OR "preventive medicine"; "anthropometry"; "ergonomics"; "musculoskeletal disorders"; "curriculum integration"; "homoeopathy" OR "homeopathy".

Period: Literature published up to September 2026, with classical homoeopathic texts included regardless of date.

Inclusion criteria: English-language sources that (a) describe an anatomical basis of a public-health problem, (b) discuss integration of basic sciences with community or primary care, or (c) discuss constitution, causation and prevention in homoeopathy.

Exclusion criteria: Opinion pieces without references, non-English sources, and duplicate reports.

Volume 2, Issue 5, September-October 2026

Synthesis: Relevant material was read in full, coded and grouped into themes by the authors. Themes were then interpreted against homoeopathic principles from the Organon and standard philosophy texts [3,13,20]. As this is a narrative review, no formal risk-of-bias scoring or meta-analysis was done.

3. Results and Discussion: Thematic Interfaces

Seven areas emerged where Anatomy and Community Medicine meet. They are summarised in Table 1 and discussed below.

Table 1. Interfaces between Human Anatomy and Community Medicine

No.	Interface	Anatomical basis	Community Medicine application
1	Anthropometry and nutrition	Body segments, bone landmarks, subcutaneous fat, muscle mass	Growth monitoring, MUAC screening, BMI, waist circumference, NFHS indicators
2	Maternal and child health	Bony pelvis, uterus, breast, fetal skull, neural tube	Antenatal care, safe delivery, breastfeeding, folic acid supplementation
3	Occupational health and ergonomics	Vertebral column, intervertebral disc, joints, muscles, lungs, ear	Work-related musculoskeletal disorders, pneumoconiosis, noise-induced hearing loss
4	Injury and accident prevention	Skull, brain coverings, cervical spine, long bones, vessels	Helmet and seat-belt use, trauma first aid, fall prevention in the elderly
5	Non-communicable and musculoskeletal diseases	Heart and coronary vessels, joints, bone density, thyroid	Screening for hypertension, osteoarthritis, osteoporosis, goitre
6	Communicable diseases and environmental health	Skin, lymphatic system, respiratory tract, gut	Filariasis, leprosy, tuberculosis, water- and food-borne diseases
7	Health education and screening	Surface anatomy, breast and oral cavity anatomy	Breast self-examination, oral cancer screening, school health check-ups

3.1 Anthropometry and nutrition

Anthropometry is applied anatomy. Height, weight, head circumference, mid-upper arm circumference (MUAC) and skinfold thickness all depend on correct anatomical landmarks [1,2]. The WHO Child Growth Standards use these measures to define stunting, wasting and underweight [9]. A MUAC below 115 mm in children aged 6–59 months is used to identify severe acute malnutrition [17]. The NFHS-5 survey reports these indicators for every district of India, guiding programmes such as POSHAN Abhiyaan [10]. A student who can locate the acromion and olecranon correctly is therefore already doing community nutrition work.

Volume 2, Issue 5, September-October 2026

3.2 Maternal and child health

The anatomy of the bony pelvis, uterus and fetal skull explains obstructed labour, one of the classical causes of maternal death [1,2]. Knowledge of neural tube development explains why periconceptional folic acid prevents spina bifida and anencephaly [2]. The anatomy of the breast and lactiferous ducts supports correct latching and breastfeeding counselling, a key child-survival intervention [2].

3.3 Occupational health and ergonomics

The structure of the lumbar spine, intervertebral disc and paraspinal muscles explains why lifting, bending and prolonged sitting cause low back pain [1,19]. Musculoskeletal conditions, led by low back pain, are the largest contributor to the global need for rehabilitation [11]. Respiratory anatomy explains the deposition of dust particles in the alveoli in silicosis and other pneumoconioses, and the anatomy of the cochlea explains noise-induced hearing loss [2]. Ergonomic advice at the workplace is, in practice, applied anatomy.

3.4 Injury and accident prevention

Road-traffic injuries remain a leading cause of death among young people, and India carries a large share of the global burden [12]. Helmet laws, seat-belt use and safe transport of the injured rest on the anatomy of the skull, meninges, cervical spine and major vessels [1,12]. In the elderly, falls and hip fractures follow from the anatomy of the femoral neck and the loss of bone density [1,2].

3.5 Non-communicable and musculoskeletal diseases

Coronary anatomy underlies the understanding of ischaemic heart disease, the leading cause of death in India [2]. The anatomy of synovial joints explains osteoarthritis of the knee, a common cause of disability in community surveys [1,11]. Thyroid anatomy and its iodine dependence form the basis of the National Iodine Deficiency Disorders Control Programme [2].

3.6 Communicable diseases and environmental health

The lymphatic system explains lymphoedema and elephantiasis in filariasis. Peripheral nerve anatomy explains thickened nerves and anaesthetic patches in leprosy. The anatomy of the respiratory tract explains droplet and airborne spread, and gut anatomy explains faeco-oral transmission [1,2]. Each of these links structure to a national control programme.

3.7 Health education and screening

Surface anatomy makes it possible to teach breast self-examination, to examine the oral cavity for premalignant lesions, and to perform school health check-ups [2]. Under Ayushman Arogya Mandir (Health and Wellness Centres), population-based screening for common cancers, hypertension and diabetes is now part of primary care [18]. These activities depend on basic anatomical skill in the field.

4. The Homoeopathic Perspective

Homoeopathy treats the person as a whole, but it does not ignore structure. The interface described above can be read through five homoeopathic concepts (Table 2).

International Journal of Advanced Multidisciplinary Research and Innovation
E-ISSN: 3107-6157 editor@ijamri.com
Volume 2, Issue 5, September-October 2026

Table 2. Homoeopathic concepts linking Anatomy and Community Medicine

Homoeopathic concept	Link to Anatomy	Link to Community Medicine
Knowledge of disease (Organon, §3)	Accurate physical examination and localisation of pathology	Recognising disease patterns in the population
Constitution and physical generals	Build, posture, bony and muscular development, gait	Nutritional status, growth, socio-economic influences on build
Exciting and maintaining causes (§5, §7)	Mechanical and structural causes, e.g. posture, injury	Occupation, housing, sanitation, diet, lifestyle
Obstacles to cure (§4, §77)	Structural lesions needing surgical or mechanical correction	Unhealthy environment and habits that must be removed
Prophylaxis and genus epidemicus	Organ affinity of the epidemic disease	Outbreak investigation and group-level preventive measures

4.1 Anatomy in the homoeopathic case

Hahnemann stated that the physician must clearly perceive what is to be cured in disease [3]. This requires a good physical examination, which in turn depends on anatomy. Location is also an element of a complete symptom. The sphere of action of many remedies is described anatomically: for example, *Bryonia alba* on serous membranes and synovial joints, *Rhus toxicodendron* on fibrous tissue and ligaments, and *Calcarea phosphorica* on bones and growth [14]. Anatomy therefore helps the physician both to understand the patient and to differentiate remedies.

4.2 Constitution, nutrition and growth

Classical authors describe constitution through build, posture, bony development and tendency to obesity or emaciation [13,20]. These are anthropometric observations. When a homoeopathic physician measures a child's height and weight against WHO standards, the same data serve the individual prescription and community nutrition surveillance [9].

4.3 Causation and the obstacle to cure

The Organon asks the physician to find and remove the exciting and maintaining causes of disease, and lists unhealthy occupation, habits and surroundings as obstacles to cure [3]. A worker with chronic low back pain from faulty lifting, or a family with recurrent diarrhoea from unsafe water, will not stay well with medicine alone. Here Community Medicine supplies the tools — ergonomic correction, health education, sanitation — that Hahnemann's principles demand [2,3]. Kent also stressed that the external conditions of life must be put in order before cure can be lasting [13].

4.4 Epidemics and population thinking

Hahnemann's work on the genus epidemicus during epidemics of scarlet fever and cholera was itself an early form of population-level thinking [3]. Modern epidemiology adds clear case definitions, surveillance and evaluation. Combining the two allows homoeopathic physicians to take part in public-health work within an evidence-based framework, as complementary care alongside national programmes.

4.5 Role in primary health care

Homoeopathic physicians serve in many rural dispensaries, AYUSH wings and health and wellness centres in India [18]. In these settings, they are often the first point of contact. A sound grasp of applied anatomy and community medicine helps them to screen, refer early, give preventive advice and prescribe safely.

5. Implications for BHMS Education

The CBDC framework gives an opportunity to teach these links deliberately [5,15]. The following steps are suggested:

1. **Shared learning objectives:** Anatomy and Community Medicine departments jointly frame objectives for topics such as anthropometry, the vertebral column and the pelvis.
2. **Early community exposure:** First-year students measure height, weight and MUAC of children during family or school visits, applying surface anatomy in the field.
3. **Case-based integrated sessions:** For example, "a construction worker with low back pain" taught jointly by Anatomy (lumbar spine), Community Medicine (occupational health) and Practice of Medicine / Materia Medica (homoeopathic management).
4. **Vertical integration:** Anatomy faculty revisit applied topics in the third and final years alongside community postings.
5. **Integrated assessment:** OSCE stations and viva questions that combine an anatomical landmark with its public-health use.
6. **Faculty development:** Joint workshops for basic-science and community-medicine teachers on integrated teaching methods.

6. Strengths and Limitations

This review is the first, to the authors' knowledge, to bring Human Anatomy, Community Medicine and Homoeopathy together in one framework. It draws on standard textbooks, WHO documents and the current Indian curriculum.

It has limitations. As a narrative review, the search was not systematic and study selection may carry author bias. Only English sources were included. Much of the homoeopathic material is classical and conceptual rather than experimental. The proposed teaching model has not yet been evaluated. Future work should include educational intervention studies and community-based research comparing integrated with conventional teaching in homoeopathic colleges.

7. Conclusion

Human Anatomy and Community Medicine are two ends of the same continuum: structure explains disease in the individual, and epidemiology explains its spread and prevention in the population. Homoeopathy, with its emphasis on the whole person, constitution, causation and the removal of obstacles to cure, provides a natural bridge between them. Integrated, case-based and community-oriented teaching of these subjects can help produce homoeopathic graduates who are competent clinicians and effective partners in India's primary health care system.

Declarations

Ethical approval: Not applicable; this review used published literature only.

Funding: None.

Conflict of interest: None declared.
